

A quickie for this PML News: we've just put up a Parachute Size vs. Weight Chart on our website. It's available in the Spec Sheet section or in the webstore under the Parachutes. This may help you in selecting chutes for your scratchbuild projects and/or for your modified PML kit. A tip for weighing your project if it's relatively heavy...try your veterinarian. They usually have electronic scales that are pretty accurate in the 5-100 pound range, so they can work well to give you an idea of the weight of your project. I weighed my 7.62" Saturn V on my vet's scale.
